# The Company at a Glance

BennieChat TechWealth Solutions combines an operating history dating back to 2021 with formal registration in February 2026, delivering practical technology that improves how businesses communicate, operate, and grow.

PRIMARY BRAND STATEMENT

## Technology That Improves Business.

**Technology for Better Business Economics** — BennieChat approaches every engagement from the perspective of the client's objectives, operational requirements, and intended outcomes. A website should do more than display information; software should simplify real work; digital platforms should provide a foundation for innovation, scalability, and sustainable growth.

VERIFICATION NOTE

Corporate particulars on this page reflect the company's Corporate Affairs Commission certificate of registration (registration number 9373701, given at Abuja on 26 February 2026) and the company's corporate records. Tax identification and compliance documentation is maintained by the company and can be provided for procurement purposes on request. The registration number alone should not be read as government vendor registration, sector prequalification, or regulatory approval.

02

# Practical Technology, Business Value First

BennieChat TechWealth Solutions is a Nigerian technology and software development business established in 2021 and formally registered in February 2026. The company provides technology-driven solutions designed to help businesses, entrepreneurs, institutions, and organisations establish stronger digital operations, improve service delivery, enhance customer engagement, and develop innovative products.

Operating at the intersection of **software development, digital transformation, business automation, web technologies, artificial intelligence, and emerging technology**, BennieChat seeks to bridge the gap between business challenges and practical technological solutions. The company serves as both a technology service provider to clients and an innovation-driven business developing digital product concepts and platforms for different markets.

From website design and development to software applications, digital platforms, workflow solutions, and technology product development, BennieChat approaches each engagement with a focus on the client's objectives, operational requirements, and intended outcomes. Engagement scope, tools, and delivery arrangements are shaped by the problem to be solved rather than by a fixed technology template.

> "Technology should deliver practical value. A website should help an organisation communicate effectively, establish credibility, reach customers, and support its commercial objectives. Software should simplify processes, improve access to information, and make work more manageable."
>
> CORPORATE PRINCIPLE · BENNIECHAT TECHWEALTH SOLUTIONS

## 02.1 What This Means for Clients

Organisations typically arrive with challenges that extend beyond their online presence: fragmented processes, inefficient recordkeeping, limited customer access, manual administrative work, disconnected information systems, and difficulty translating business ideas into functional digital products. BennieChat's role is to identify the required business outcome first, and then determine how technology — a website, an application, an automation, or a platform — can support it.

SERVICE PROVIDER

### Client-Facing Technology Services

Website design and development, software and web applications, digital platforms, workflow improvement, automation, and technology consulting — delivered against defined requirements and documented deliverables.

INNOVATION

### Proprietary Product Initiatives

An internal product-development direction exploring digital platforms and AI-oriented concepts for selected markets, including GetiDone, ROSCA AI™, HotelShield™, and Zoniva TV, each presented according to its actual maturity.

This dual direction keeps the company grounded in commercial reality: client service work sharpens its understanding of recurring business needs, while product initiatives convert that understanding into reusable technology. Both activities are reported distinctly so that prospective clients always know which deliverables are client projects and which are internal products or experiments.

03

# From Digital Services to Registered Technology Business

BennieChat's progression reflects a deliberate movement from basic online representation towards more useful and integrated digital capabilities — for clients and for the company's own product concepts.

2021 · FOUNDATION

### Business Establishment

Commencement of the company's technology and digital-services journey, with its foundation in website development, digital services, and the practical application of technology to business needs.

2021 ONWARDS · CLIENT PROJECTS

### Portfolio Growth Across Sectors

Development of experience in website creation and digital presentation for businesses across different sectors — including work associated with engineering, oil and gas, fashion, consulting, and the company's own digital presence.

DEVELOPMENT PHASE · CAPABILITY EXPANSION

### Beyond Conventional Websites

Expansion of the scope of work beyond conventional websites to include software applications, digital platforms, business process improvement, artificial intelligence initiatives, and proprietary technology products.

INNOVATION PHASE · PRODUCT CONCEPTS

### Proprietary Technology Initiatives

Development and exploration of proprietary technology initiatives, including GetiDone, ROSCA AI™, HotelShield™, and Zoniva TV — each at a different stage of maturity and presented accordingly.

26 FEBRUARY 2026 · FORMAL REGISTRATION

### CAC Business Name Registration

BennieChat TechWealth Solutions registered under the Companies and Allied Matters Act 2020 (registration number 9373701) — a new stage of institutional development building upon the operational history dating back to 2021.

CURRENT DIRECTION

### Technology and Business Solutions

Continued focus on software development, digital transformation, automation, digital platforms, and institutional technology solutions — offered alongside the company's continuing product-innovation work.

DATING POLICY

Individual project dates are published only where they can be verified from project records. The timeline above reflects the company-level milestones documented in the corporate profile; it does not assign dates to specific client engagements.

04

# What Guides the Work

VISION

To become a trusted technology and innovation partner helping businesses and institutions harness digital solutions to improve operations, create value, and participate more effectively in an increasingly technology-driven economy.

MISSION

To design, develop, and implement practical technology solutions that address real business challenges through software development, digital platforms, automation, digital transformation, and continuous innovation.

## 04.1 Corporate Values

Seven values shape how BennieChat engages with clients, scopes its work, and represents its capabilities. They are working principles — applied in proposals, project communication, and delivery — rather than aspirational statements.

01 **Innovation**
We explore and apply appropriate technologies to develop practical solutions for evolving business and institutional needs.

02 **Business Value**
We consider the purpose behind each technology project and seek solutions that align with operational objectives and measurable requirements.

03 **Professionalism**
We emphasise clear communication, defined deliverables, responsible project execution, and appropriate documentation.

04 **Integrity**
We aim to represent our capabilities, project experience, and service commitments honestly — including the maturity of each product initiative.

05 **Client Focus**
We recognise that organisations have different operational realities and therefore require solutions suited to their individual circumstances.

06 **Continuous Improvement**
We support ongoing learning, experimentation, product development, and improvement of our technology capabilities.

07 **Accessibility**
We seek to make useful digital tools and technology services accessible to businesses and institutions with different levels of technical capacity — meeting organisations where they are, and building capability as engagement progresses.

05

# More Than Website Design

BennieChat TechWealth Solutions is positioned as a technology and digital solutions provider rather than solely a website-design business. Website development remains an important part of the service portfolio, but the company's broader direction encompasses software, web applications, digital platforms, workflow improvement, automation, and emerging technology initiatives.

The companies BennieChat works with often face challenges extending beyond their online presence. These may include fragmented processes, inefficient recordkeeping, limited customer access, manual administrative work, disconnected information systems, and difficulty translating business ideas into functional digital products. BennieChat approaches these challenges by identifying the required business outcome and determining how technology can support it — whether that outcome calls for a corporate website, a management application, a digitised workflow, or a combination of these.

## 05.1 Our Approach to Technology

Every engagement follows five working principles. The precise process, tools, testing arrangements, documentation, and maintenance obligations are then tailored to the nature and scale of each assignment.

STEP 01

**Understand the Requirement**

Establish the business problem, intended users, scope, and expected deliverables.

STEP 02

**Design the Solution**

Develop a suitable technical and operational approach for the requirement.

STEP 03

**Build the Capability**

Implement the agreed website, software, platform, or digital workflow.

STEP 04

**Validate the Deliverable**

Test the solution against agreed requirements and correct identified issues within scope.

STEP 05

**Support Implementation**

Provide handover information, guidance, documentation, or ongoing support as agreed.

## 05.2 How Capabilities Are Presented

The company distinguishes deliberately between **established service experience** — areas with delivered work or documented engagement history — and **developing capabilities**, which are areas of active interest and exploration offered subject to project fit. This distinction is preserved throughout this profile so that procurement evaluators and prospective clients can weigh each capability on its actual evidence.

ESTABLISHED EXPERIENCE

**Website & Digital Presence Development**

Corporate, business, and professional websites across engineering, oil and gas, consulting, and fashion contexts, plus the company's own digital operations — supported by publicly accessible project references.

DEVELOPING CAPABILITIES

**Software, Automation, AI & Platform Work**

Software applications, workflow digitisation, AI-oriented and blockchain-related solutions, and SaaS concepts — offered according to project requirements, with maturity and evidence stated honestly in any proposal.

06

# Ten Service Areas, One Business Outcome

The portfolio spans the full journey from first online presence to integrated digital operations. Each capability is scoped per engagement — the feature set, platform, and delivery approach follow the requirement, never the reverse.

SERVICE 01

### Website Design & Development

Corporate, e-commerce, and professional websites built to support commercial objectives.

SERVICE 02

### WordPress & No-Code

Practical delivery on WordPress and no-code platforms where they fit the requirement.

SERVICE 03

### Software & Web Apps

Business applications, dashboards, portals, record systems, and MVPs.

SERVICE 04

### SaaS & Digital Products

Subscription-software concepts, multi-user platforms, and digital service tools.

SERVICE 05

### Digital Transformation

Digitising workflows, forms, and records; structuring business information.

SERVICE 06

### Workflow Automation

Automated forms, notifications, record processing, approvals, and reports.

SERVICE 07

### AI & Data Solutions

AI-enabled applications and decision support — concept, prototype, and production distinguished.

SERVICE 08

### Blockchain & Web3

BaaS concepts, Web3 platforms, and integrations — scoped per feasibility and risk.

SERVICE 09

### E-Commerce

Catalogues, storefronts, ordering workflows, accounts, and payment integrations.

SERVICE 10

### Consulting & Training

Requirements analysis, platform selection, project planning, and practical training.

CAPABILITY REPRESENTATION

Services marked with a violet accent (07–08) are presented as developing capabilities: areas of genuine technical interest and exploration offered subject to project fit and feasibility assessment. Formal training certifications, accreditation, and institutional recognition are advertised only where documented evidence exists. Detailed capability descriptions follow in Section 07.

# What BennieChat Delivers

Capability descriptions below summarise the potential deliverables and working considerations for each service area. The final feature set for any engagement depends on the selected platform, service providers, transaction requirements, and project scope agreed with the client.

## 07.1 Website Design & Development

BennieChat provides website design and development services for businesses, organisations, entrepreneurs, and professional service providers. The company has undertaken website work associated with businesses in engineering, oil and gas, consulting, and its own technology operations, and treats the website as a working business asset rather than a static brochure. Potential deliverables include:

- Corporate and institutional websites, business information websites, and professional service websites.
- E-commerce websites and online stores, product and service landing pages, and portfolio or company-profile websites.
- Website redesign and modernisation, responsive layouts for desktop, tablet, and mobile.
- Content organisation and presentation, contact forms and enquiry workflows, administration and content management.
- Domain registration and hosting arrangements where included in the engagement, plus maintenance and improvement services where contracted.

## 07.2 WordPress & No-Code Development

The company's website-development background includes WordPress and no-code implementation. This capability supports organisations seeking practical digital solutions without requiring every component to be developed entirely from scratch. The suitability of WordPress or another platform is determined by the project's functional, security, performance, and maintenance requirements. Depending on project requirements, work may include:

- WordPress website implementation, theme and page-builder configuration, and content management systems.
- Plugin selection and configuration, e-commerce implementation, and membership or user-access functionality.
- Business landing pages, website extensions and integrations, and website updates and maintenance.

## 07.3 Software & Web Application Development

BennieChat's wider technology direction includes the development of software and web-based applications intended to address defined business or user requirements. The technical architecture, programming languages, databases, hosting environment, and delivery approach are selected according to the actual project specification. Potential engagements include:

- Browser-based business applications, administrative dashboards, and customer-facing portals.
- Internal management tools, user registration and access workflows, and data-entry and record-management systems.

- Business process applications, online service platforms, application integrations, and minimum viable products for new business ideas.

### 07.4 SaaS & Digital Product Development

Software as a Service is an important part of BennieChat's product-development direction. The company explores and develops digital product concepts intended to make selected services available through online platforms. Individual products may be at different stages — concept, planning, prototype, development, testing, or deployment — and their status is stated accurately in any formal proposal. Relevant areas include:

- Subscription-based software concepts, multi-user platforms, and online business tools.
- Digital service marketplaces and workflow-oriented applications.
- User dashboards and account management, digital product prototyping, feature planning, product architecture, and MVP planning and development.

### 07.5 Digital Transformation & Business Process Improvement

BennieChat helps organisations explore opportunities to use digital tools to improve existing business processes. The purpose is not to introduce technology for its own sake, but to determine whether a digital solution can genuinely improve the way a task or service is performed. Depending on the engagement, this may involve:

- Reviewing manual workflows and digitising forms and records.
- Improving information accessibility and establishing structured digital records.
- Developing online service channels and improving the organisation of business information.
- Integrating suitable digital tools, reducing administrative duplication, and designing workflow-oriented software solutions.

### 07.6 Workflow Automation

Business process automation supports organisations seeking to simplify repetitive administrative tasks. Specific automation capabilities are defined after assessing the existing process, data sources, system compatibility, access requirements, and operational risks. Potential solutions include:

- Automated form submissions and notifications, digital record-processing workflows, and structured data collection.
- Administrative task automation and report-generation workflows.
- System integrations, automated communication processes, and approval and status-tracking workflows.

### 07.7 Artificial Intelligence & Data-Oriented Solutions

Artificial intelligence is part of BennieChat's technology and product-innovation interests. The company distinguishes carefully between an AI concept, a working prototype, a validated model, and a production-ready system — and claims about accuracy, reliability, or commercial performance are made only when supported by appropriate evidence. Relevant areas of exploration and development include:

- AI-enabled business applications and intelligent information-processing workflows.
- Predictive analytics concepts and data-driven decision-support tools.
- AI-assisted digital services, AI product planning and prototyping, statistical analysis and predictive modelling concepts, and intelligent search and information retrieval.

## 07.8 Blockchain & Web3-Related Solutions

BennieChat has also explored blockchain-related technology and digital business models. The scope of an actual blockchain engagement depends on the client's requirements, applicable laws, technical feasibility, and project-specific risk assessment. Areas of interest include:

- Blockchain as a Service (BaaS) concepts and Web3-oriented digital platforms.
- Decentralised technology applications and digital community platforms.
- Blockchain-related product planning and integration concepts involving conventional web technologies and blockchain systems.

## 07.9 E-Commerce & Digital Commerce

The company supports online commercial operations through appropriate website and application solutions. The final feature set depends on the selected platform, service providers, transaction requirements, and project scope. Potential capabilities include:

- Online product catalogues, digital storefronts, and product and service presentation.
- Online enquiry and ordering workflows and e-commerce website implementation.
- Customer account functionality, referral and commission feature planning, and integration with suitable payment or delivery services.

## 07.10 Technology Consulting & Training

BennieChat's wider service direction includes helping clients identify suitable technology approaches and supporting technology education. Formal training certifications, accreditation, and institutional recognition are advertised only where documented evidence exists. Potential engagements may include:

- Technology requirements analysis, digital project planning, and website and software project consultation.
- Platform selection and digital product planning.
- Introduction to website development, practical technology training, and guidance on digital tools and online business operations.

08

# Work That Can Be Examined

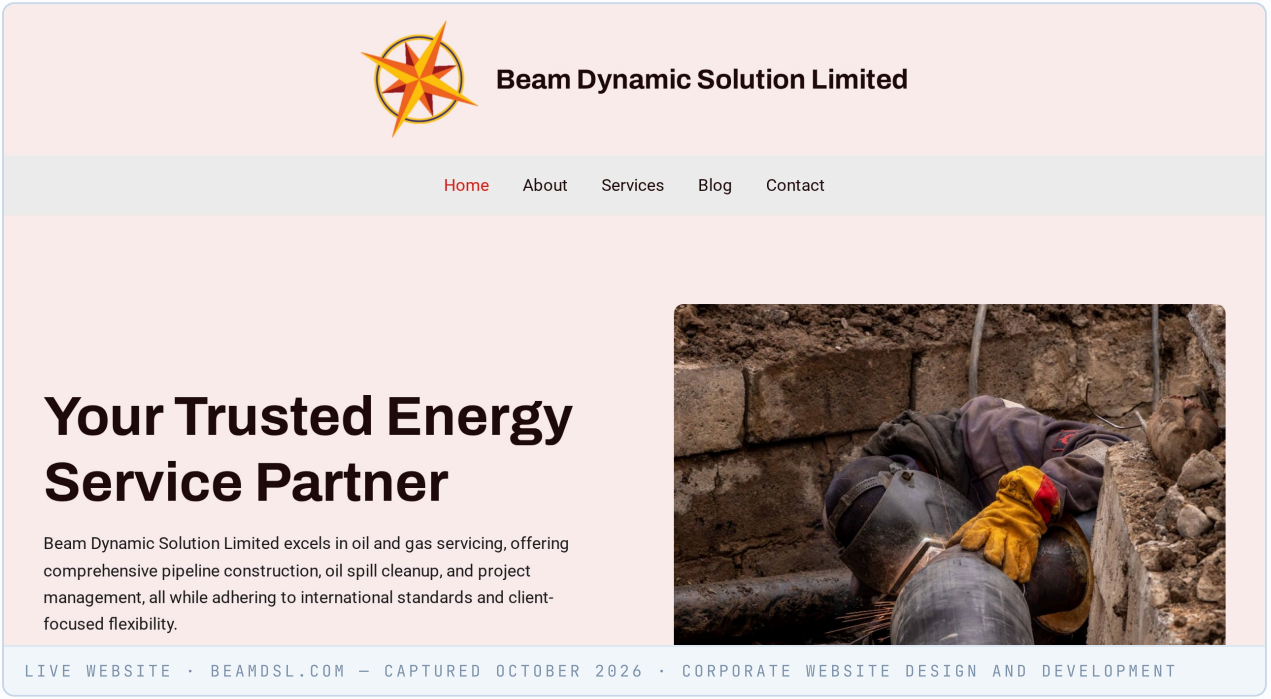

The portfolio includes website work for businesses across different sectors. Entries below carry explicit classifications: a completed website project, a company-profile assignment, an associated business, and a proposed technology initiative are distinct categories and are never presented interchangeably.

## Beam Dynamic Solutions Limited

COMPLETED WEBSITE · LIVE

ENERGY · OIL & GAS SERVICING

Beam Dynamic Solutions Limited is an important reference in BennieChat's website portfolio, demonstrating experience creating a dedicated online presence for a business in the professional and engineering-related space — supporting the presentation of organisational information, business services, professional credibility, and client-engagement channels.

LIVE WEBSITE · BEAMDSL.COM — CAPTURED OCTOBER 2026 · CORPORATE WEBSITE DESIGN AND DEVELOPMENT

**ENGAGEMENT TYPE**
Corporate website design & development

**CAPABILITY DEMONSTRATED**
Corporate web presence for an energy-sector company

**EVIDENCE**
www.beamdsl.com (publicly accessible)

## Mekadyne Oil and Gas Limited

WEBSITE · PORTFOLIO REFERENCE

OIL & GAS

Mekadyne Oil and Gas Limited is represented in the publicly listed portfolio associated with the founder's website-development work — a relevant example of digital presentation for an oil and gas sector business, useful when presenting BennieChat's experience to technical, industrial, and corporate markets.

ENGAGEMENT TYPE

**Business website design & development**

CAPABILITY DEMONSTRATED

**Digital presentation for an oil & gas organisation**

REFERENCE

www.mekadyneoilandgas.org.ng

SCOPE CLARIFICATION

This website project is not presented as evidence that BennieChat has executed oilfield construction, fabrication, installation, or other physical oil and gas operations. BennieChat's role is that of a technology and digital solutions provider.

## Harper's Concept Limited

WEBSITE + CORPORATE CONTENT

ENGINEERING · MARINE · CONSULTING

Harper's Concept Limited appears in the founder's publicly listed website portfolio — experience in the digital presentation of a company whose proposed service areas include engineering, marine, oil and gas, and consulting, requiring clear information architecture for different audiences. Separately, Harper's Concept has been associated with **corporate content-development work** covering marine, oil and gas construction, civil engineering, waste management, and business services; the preparation of service content is distinguished from the implementation of the company's website.

ENGAGEMENT TYPE

**Corporate web development · business-service presentation**

ALSO ASSOCIATED

**Corporate content & service-portfolio organisation**

REFERENCE

www.harpersconceptltd.com

## BennieChat TechWealth Solutions — Digital Presence

OWN PLATFORM

TECHNOLOGY · CORPORATE IDENTITY

BennieChat maintains its own online presence as part of its corporate identity and digital-business activities — a point of reference for the company's services, brand, and contact information, usable alongside selected project links as a practical starting point for reviewing the company's work.

REFERENCE

www.benniechat.onrender.com

## 08.1 Associated Businesses & Corporate-Content Work

The engagements below are associated with the founder's broader commercial, digital-services, and corporate-communication background. They demonstrate relevant business context; each carries its own classification and none is represented as a completed website contract unless separate evidence confirms that scope.

| BUSINESS / ENGAGEMENT | CLASSIFICATION | CONTEXT & RELEVANCE |
|---|---|---|
| Tabit Clothing & Accessories | Associated business (fashion & retail) | Female clothing and accessories with online tutorials on accessory production and millinery materials — context for product catalogues, e-commerce, online training information, and enquiry workflows. Listed as a completed project only when a URL or delivery evidence is available. |
| IfyGold Collections | Associated business (fashion & general merchandise) | Male and female clothing, underwear, kitchen utensils, household goods, and accessories — context for retail-focused technology, catalogues, online commerce, and digital customer engagement. Completed deliverables listed separately once evidence is confirmed. |
| VATEX Engineering Services | Company-profile & corporate-content work | Company-profile development and corporate communication in the engineering and oil servicing context (civil, oil and gas, mechanical) — demonstrates corporate content, professional presentation, and business materials for technical service providers; not represented as a website-development contract. |

09

# A Verifiable Way to Assess the Work

BennieChat encourages evidence-based evaluation. The current publicly listed portfolio associated with the founder includes Beam Dynamic Solutions Limited, Mekadyne Oil and Gas Limited, Harper's Concept Limited, and the BennieChat website. For formal submissions, each major project is supported by the strongest evidence available, presented through a portfolio appendix.

## 09.1 Project Evidence Matrix

| EVIDENCE TYPE | PURPOSE |
|---|---|
| Live website | Demonstrates an accessible digital deliverable |
| Screenshots | Show selected interface features and presentation |
| GitHub repository | Demonstrates source-code evidence where public disclosure is authorised |
| Project specification | Documents the intended scope |
| Delivery or acceptance record | Helps establish completion and acceptance |
| Client reference | Provides independent confirmation where available |
| Product demonstration | Shows current functionality |
| Technical documentation | Explains architecture, implementation, or operation |
| Test report | Records relevant validation results |

## 09.2 Portfolio Appendix Standards

Formal submissions may include a portfolio appendix containing, for each listed project: the project or client name; the type of service delivered; the project completion date where verifiable; the public website or authorised demonstration link; relevant screenshots; a brief scope of work; an available client reference or testimonial where authorised; and the project status with any applicable limitations.

**INTERPRETATION GUIDANCE**

The existence of a public website or repository is useful evidence, but it does not independently establish the full contractual scope, ownership of every component, or client acceptance. Completed client deliverables, internal products, proposed systems, and founder-related professional experience are separate categories — descriptions in this profile preserve those distinctions, and evaluators are invited to request the specific evidence relevant to their assessment.

# Building Beyond Client Work

BennieChat's work is not limited to client-facing services. The company develops and explores proprietary digital products and technology concepts that demonstrate its interest in applying technology to different markets and business problems. Because product maturity varies, each initiative is presented according to its actual status.

## Zoniva TV

CONCEPT & FUNCTIONAL DIRECTION

DIGITAL MEDIA · TELEVISION-PLATFORM INITIATIVE

A digital television-platform initiative exploring a continuous, channel-based viewing experience using content originating from YouTube — closer to conventional television, where viewers select a channel and encounter a continuous sequence of programmes rather than selecting each video individually. The concept involves arranging content into channels with scheduling, transitions, channel identity and navigation, and a television-like viewing flow; technical considerations include continuous playback, embedding compatibility, content availability, platform restrictions, and rights. The intended differentiation is the organisation and presentation of available video content into a familiar television-style experience.

STATUS NOTE — Available project history establishes the concept and functional direction. Current implementation stage (prototype, application under development, or deployed product) is confirmed before any formal proposal. Spelling is preserved as “Zoniva TV” per source records; the name has also been referenced as “Zonita TV” and official spelling is being confirmed.

## GetiDone

INTERNAL VENTURE

PROPRIETARY DIGITAL VENTURE

GetiDone is a proprietary digital venture associated with BennieChat TechWealth Solutions and its founder, forming part of the company's broader product-development portfolio. In formal contexts it is described with a concise, accurate account of its intended users, the principal problem it addresses, its main functions, and its current stage of development.

STATUS NOTE — The actual feature set, live status, and available demonstration are verified before the profile makes specific product-performance claims.

## ROSCA AI™

INTERNAL VENTURE · AI DIRECTION

PROPRIETARY AI-ORIENTED VENTURE

ROSCA AI™ is a proprietary technology initiative associated with BennieChat TechWealth Solutions and founder Wada Oluwapelumi Benedict, forming part of the company's AI-oriented product-development direction and demonstrating its interest in building technology products beyond conventional client websites.

STATUS NOTE — The final product description specifies its verified purpose, intended audience, core features, and implementation status; performance claims are supported by documented evidence.

### HotelShield™

PROPRIETARY TECHNOLOGY INITIATIVE · HOSPITALITY

INTERNAL VENTURE

HotelShield™ is another substantial product initiative in BennieChat's portfolio of internal products and innovation initiatives. Depending on its confirmed scope, the hospitality sector may be a relevant market; any formal description of hospitality-specific functions is based on the product's actual specification rather than assumptions about what a hotel-management platform normally provides.

STATUS NOTE — The exact functional description and current maturity (concept, development, testing, or deployment) are confirmed before publication.

## 10.1 Proposed Systems & Concept Explorations

The initiatives below are documented concepts and proposed systems: their listed functions describe planned scope, not proof of implementation, and they are never presented as completed engagements without an executed engagement and delivered system. Across this portfolio, each initiative carries exactly one supported classification — product, internal venture, concept, proposed system, prototype, in development, or deployed product — and client-service activities are distinguished from proprietary product work in all corporate reporting.

PROPOSED SYSTEM · EDUCATION

### Mountain-Top Theological Seminary — LMS Concept

Planning work on a proposed WordPress-based LMS and online university-operations solution. Envisioned features include student, lecturer, and administrative dashboards; automatic matriculation-number generation; admission-letter automation; progress tracking; online lectures via Zoom; exam registration; course management; customisable forms; ID-card generation; payment integration; and a student reward system. Status: proposed system — not a completed engagement.

CONCEPT · AI & SPORTS ANALYTICS

### AI-Powered Football Match Prediction Application

An AI web-application concept analysing football matches from historical performance and statistical data — recent form (approximately five to ten previous matches) generating probability-oriented predictions across match outcomes, double-chance results, both-teams-to-score, team scoring, win-either-half, and over/under markets. The original 80% confidence-threshold display requirement is a design objective, not evidence of achieved accuracy, which would require historical testing, calibration, and out-of-sample validation.

CONCEPT · SOCIAL PLATFORM

### AI, Blockchain & Cryptocurrency Social Platform

A social-platform concept focused on AI, blockchain, and cryptocurrency, drawing on features associated with social networking, professional networking, short-form video, and visual-content platforms. Intended audience: enthusiasts, professionals, builders, and participants in these communities. Proposed planning areas: user profiles, community participation, content publishing, professional networking, media sharing, and topic-based discovery — concept elements, not deployed functions unless implementation is verified.

INTERNAL INITIATIVE · INVENTORY

### Automated Bin Card Inventory Workflow

An inventory-management workflow developed around Excel, tracking fabrication materials such as beams, U-channels, mild-steel plates, gratings, and Z-purlins — improving material tracking and inventory visibility in a fabrication environment, and demonstrating practical interest in digital tools for industrial administration.

11

# Where the Capabilities Apply

BennieChat's services and project initiatives are relevant to a range of industries. The areas below describe where capabilities may be applied — they do not imply that the company has completed projects for every organisation or sector mentioned.

SECTOR 01

### Oil & Gas

Corporate websites, digital presentation of technical services, portals and enquiry systems, administrative applications, record management, workflow automation, material tracking, and technology consulting. Portfolio includes website work associated with Mekadyne Oil and Gas Limited. BennieChat's role is that of a technology provider — a sector website project does not establish qualification for drilling, fabrication, or other physical oilfield operations.

SECTOR 02

### Engineering & Industrial Services

Corporate websites, service catalogues, digital company profiles, material tracking, inventory workflows, project documentation, administration tools, and internal dashboards. The founder's engineering-environment exposure provides useful context for industrial workflows; founder experience and company-delivered projects are documented separately.

SECTOR 03

### Government & Public-Sector Institutions

Institutional websites, online portals, digital forms, application and enquiry workflows, administrative web applications, document management, workflow automation, and training support. Public-sector engagement is subject to relevant procurement requirements, specifications, and data-handling obligations; vendor status is claimed only when records exist.

SECTOR 04

### Education & Training

Institutional websites, learning management systems, student portals, course-management tools, online registration, and administrative dashboards. The Mountain-Top Theological Seminary LMS concept demonstrates interest in educational technology; its proposed status remains explicit unless delivery is verified.

SECTOR 05

### Fashion, Retail & E-Commerce

Fashion and retail websites, online stores, product catalogues, customer enquiry systems, digital-marketing landing pages, and referral-feature planning. Tabit Clothing and Accessories and IfyGold Collections provide relevant examples of businesses that may benefit from these capabilities.

SECTOR 06

### Hospitality & Digital Services

BennieChat's digital-product development direction includes HotelShield™. Depending on the product's confirmed scope, the hospitality sector may be a relevant market; any description of hospitality-specific functions is based on the product's actual specification rather than assumptions.

SECTOR 07

### Technology Start-ups & Entrepreneurs

Business websites, product landing pages, MVP planning, web applications, SaaS concepts, and product architecture planning. This area aligns with the company's combination of client-service work and internal product initiatives: the disciplines of shipping a product — scoping, sequencing, validating, iterating — are the same ones BennieChat applies when helping an entrepreneur take an idea to a working first release.

12

# The Person Behind the Practice

WB

FOUNDER · BENNIECHAT TECHWEALTH SOLUTIONS

## Wada Oluwapelumi Benedict

A Nigerian technology entrepreneur whose work spans website development, digital solutions, technology product planning, and project-related activities.

Wada Oluwapelumi Benedict began building his professional experience in website development and related digital services before the formal registration of BennieChat TechWealth Solutions in February 2026. His experience includes approximately **seven years of freelance website-design work**, with a focus on WordPress and no-code development, alongside wider interests in software applications, SaaS, AI, blockchain-related solutions, and digital transformation.

He has been involved in projects and initiatives covering different business contexts, including engineering-related websites, corporate service presentation, fashion and retail businesses, educational technology concepts, digital product development, and workflow automation. His project-planning background also contributes to an understanding of requirements, work sequencing, progress monitoring, and the importance of organising deliverables around defined objectives.

### 12.1 Relevant Professional Background

TECHNICAL & DELIVERY

**Documented Background**

Website design and development · WordPress and no-code development · web-development training and certifications · project-planning experience · PMI-related Agile and Waterfall project-management certifications, as previously reported · membership of the International Association of Project Managers, as previously reported · training in Biblical Theology, with certification previously described as pending completion of the final project.

ENGINEERING EXPOSURE

**Project Environment Experience**

Professional project history includes exposure to the Obiafu 2 Wellhead Fire Intervention project; the OML 13 project for SEEPCO; and fabrication and installation of structural sheds and a platform at GPP-2 in Kwale, Delta State. These engagements relate to the founder's professional experience in project planning and engineering environments.

IMPORTANT DISTINCTION

The founder's engineering-exposure engagements should not be represented as contracts executed by BennieChat TechWealth Solutions unless company records establish that the company was the contracting party. Formal applications use the exact names of awarding bodies, certification titles, dates, and membership status shown on the original documentation. A founder portrait is published only where an authentic portrait is supplied or explicitly authorised.

### 12.2 Leadership Approach

The founder's approach combines practical digital-service delivery with an interest in developing reusable technology products. This supports the company's dual direction: providing technology services to clients while exploring products that address recurring needs in selected markets — translating into scoped deliverables, sequenced work plans, and documented handover on engagements of every size.

13

# Structured Delivery, Honest Validation

BennieChat aims to structure technology engagements around clearly defined requirements and deliverables. The exact delivery methodology depends on the size and complexity of the assignment.

## 13.1 The Delivery Lifecycle

PHASE 01

### Requirements Definition

Understand the client's objectives, users, existing systems, required features, constraints, and expected outcomes.

PHASE 02

### Scope & Planning

Organise agreed activities, deliverables, milestones, and responsibilities. Larger assignments may include a work breakdown structure, schedule, risk register, and requirements matrix.

PHASE 03

### Design & Implementation

Select the technical solution according to requirements. Implementation may include website configuration, application development, integrations, workflow design, or product prototyping.

PHASE 04

### Validation & Review

Review the delivered solution against the agreed scope — functionality checks, responsive-layout checks, form validation, integration checks, and other relevant tests.

PHASE 05

### Handover & Support

Where included in the contract: access and account information, administrative guidance, documentation, deployment information, maintenance arrangements, training, and agreed post-delivery support.

QUALITY COMMITMENTS

Support periods, service-level agreements, response times, warranties, and maintenance obligations are defined contractually rather than assumed. BennieChat does not claim formal ISO-certified processes or accredited quality-management systems; quality is pursued through the structured lifecycle above, documented deliverables, and review against agreed scope.

## 13.2 Security, Privacy & Professional Responsibility

BennieChat recognises that websites and software applications may process information that is important to a client's operations. Technology engagements therefore consider the security and privacy requirements relevant to each project. Depending on scope, these considerations may include:

- Appropriate account and access management, and protection of credentials and secrets.
- Suitable hosting and deployment arrangements and secure configuration.
- Data-collection minimisation and appropriate handling of personal information.
- Backup and recovery considerations, and documentation of system responsibilities.
- Compliance with applicable contractual and legal requirements.

Specific security certifications, formal information-security management systems, penetration-testing capabilities, or regulatory approvals are claimed only when verified. For projects involving personal data, applicable Nigerian data-protection requirements and other legal obligations are assessed per project — distinguishing good-practice principles from formally certified or independently audited controls.

14

# Ready for Institutional Engagement

BennieChat TechWealth Solutions seeks opportunities to provide appropriate technology and digital services to private companies, public-sector institutions, educational organisations, and other businesses. Potential areas of engagement include website design and development; corporate and institutional digital platforms; web application development; software and digital product development; business workflow digitisation; automation and systems integration; digital content and corporate website presentation; technology consulting; selected AI-oriented development initiatives; and training and technology support, subject to agreed scope.

## 14.1 Government & Institutional Procurement

For procurement opportunities, the company provides a submission tailored to the specific tender or request for proposal. Depending on the procuring entity's requirements, a submission may include the corporate profile and capability statement, CAC registration documentation, applicable tax identification and tax-compliance documentation, required vendor registration, relevant technical qualifications and certifications, technical and commercial proposals, a project schedule, CVs of proposed personnel, evidence of similar work, client references and acceptance records, and required declarations and compliance forms. The company submits only documents that are valid, applicable, and available.

REGISTRATION & PREQUALIFICATION STATUS

The existence of a CAC registration number does not by itself establish government vendor registration, oil and gas prequalification, tax clearance, or sector-specific approvals. BennieChat does not imply unverified prequalification or regulatory approval in any submission.

## 14.2 Oil, Gas & Engineering Technology Capability

BennieChat can present its technology capabilities to oil and gas organisations seeking digital services, corporate websites, software solutions, workflow applications, or other technology-related deliverables. Appropriate examples include corporate websites, digital service presentation, software, workflow tools, material-tracking solutions, and administrative applications. The company should be considered for assignments that align with its verified technical capacity and the relevant procurement requirements.

Where a tender requires physical construction, fabrication, well intervention, equipment supply, field operations, or regulated engineering services, the company must demonstrate the necessary corporate capacity, personnel, equipment, qualifications, and approvals before claiming suitability. **The founder's exposure to engineering and project-planning environments may provide useful context, but it does not automatically qualify BennieChat as a physical oilfield-services contractor** — and the corporate profile keeps founder-related project exposure separate from BennieChat corporate contract history.

# Technical Evidence & Practical Differentiators

## 15.1 GitHub & Technical Portfolio

BennieChat intends to make relevant technical work accessible through its GitHub portfolio: [www.github.com/benniechat](http://www.github.com/benniechat) (as listed in the company's corporate records; the profile URL is being re-verified for formal submissions). Where repositories are public and authorised for disclosure, they can provide evidence of source-code organisation, software architecture, application features, development progress, documentation, configuration and implementation approaches, issue tracking and development history, technology experiments, product prototypes, and selected open-source contributions.

DISCLOSURE DISCIPLINE

Not every repository is necessarily public. Proprietary client source code, confidential business information, credentials, private keys, and sensitive configuration data are not disclosed without appropriate authorisation. Repository names, technology stacks, and demonstration links are cited in proposals only where verified.

## 16.1 Why Organisations Work With BennieChat

Six evidence-based differentiators — each grounded in the material presented in this profile rather than in superlatives.

DIFFERENTIATOR 01

### Experience Across Business Contexts

The portfolio associated with the founder includes website projects for businesses in engineering-related services, oil and gas, and corporate consulting — relevant experience in presenting businesses and their services through digital channels.

DIFFERENTIATOR 02

### A Broader Technology Perspective

BennieChat's direction extends beyond conventional website delivery to include software, digital platforms, workflow improvement, and proprietary product initiatives.

DIFFERENTIATOR 03

### Business-Oriented Solutions

The company seeks to understand the problem a client is trying to solve before determining the appropriate technological approach — technology follows the outcome, not the trend.

DIFFERENTIATOR 04

### Adaptable Remote-First Delivery

A remote-first operating model organises engagements through digital communication and online collaboration — suited to distributed clients and phased institutional projects.

DIFFERENTIATOR 05

### Interest in Continuous Innovation

Internal product initiatives — from GetiDone to ROSCA AI™ and HotelShield™ — demonstrate a continuing interest in exploring digital solutions for different markets.

DIFFERENTIATOR 06

### Direct, Honest Communication

Official website, email, and telephone channels provide direct routes to discuss requirements, request proposals, and explore engagements — with capabilities and product maturity represented accurately.

# Verified Particulars, Documented Readiness

17

## 17.1 Verified Corporate Information

| PARTICULAR | DETAIL |
|---|---|
| Registered business name | BennieChat TechWealth Solutions |
| CAC registration number | 9373701 |
| Legal form | Business name registered under the Companies and Allied Matters Act 2020 |
| Date of registration | 26 February 2026, given at Abuja |
| Registered nature of business | Technology & Software |
| Operating location & model | Ughelli North, Delta State, Nigeria · remote-first delivery |

## 17.2 Procurement Documentation Checklist

The documentation below is compiled per submission; the company states only what it possesses, distinguishing documents currently held from those prepared per opportunity.

| DOCUMENTATION | STATUS | NOTES |
|---|---|---|
| CAC certificate of registration | Held | Business name registration, No. 9373701 |
| Tax identification documentation | Held | Provided for procurement on request |
| Corporate profile & capability statement | Held | This document |
| Portfolio appendix & evidence pack | Held | Per Section 09 standards |
| Tax clearance certificate | Per submission | Renewed as required per opportunity |
| Vendor registration | Per entity | Completed per procuring entity's process |
| Technical & commercial proposals | Per tender | Tailored to the specification |

### 17.3 · SUBMISSION PRINCIPLES

Only documents that are valid, applicable, and available are submitted for any opportunity. Legal particulars are reproduced exactly as they appear on the company's CAC documentation; the registration number alone is never used to infer unverified regulatory classifications or approvals. Project evidence follows the classification standards of Sections 08–09 and product maturity follows the status standards of Section 10. Proposed team structure, subcontractor arrangements, or specialist resources are disclosed accurately in the relevant proposal.

# Start a Conversation

BennieChat TechWealth Solutions welcomes enquiries relating to suitable technology, software development, website development, digital transformation, automation, and digital product engagements.

| BUSINESS POSITIONING | Technology That Improves Business. |

## 18.1 How to Request a Proposal

Organisations seeking a proposal are invited to provide a description of their requirements, intended outcomes, expected timeline, and any relevant technical or procurement documentation. With this information, BennieChat can respond with an appropriate scoping approach — whether the need is a corporate website, a software application, a digitised workflow, or a longer digital-transformation engagement.

## 18.2 Corporate Declaration

BennieChat TechWealth Solutions presents this corporate profile to provide an overview of its business history, technology service areas, selected portfolio, proprietary product initiatives, and potential areas of engagement. Project descriptions should be read according to their stated classifications: completed client deliverables, internal products, proposed systems, and founder-related professional experience are not interchangeable categories.

Any contract award, regulatory approval, certification, vendor registration, client reference, project metric, or technical qualification required for a specific engagement should be supported by the relevant documentation. The company is committed to pursuing suitable opportunities in line with its actual capabilities, project requirements, and applicable contractual obligations.
